

Kirunal

What is Kirunal used for?

Kirunal has been developed to provide the brain with specific nutrients it needs to function properly. Each capsule of Kirunal contains 500 mg. of specially selected fish oil that provides three times more EPA (eicosapentaenoic acid) than DHA (docahexaenoic acid).

Why Increase your EPA intake?

The brain is rich in a group of fatty substances known as the Omega-3 Essential Fatty Acids, including EPA. Omega-3 EFA's are critical to the normal functioning of the brain, but cannot be made within the body. They must be ingested as food, digested, absorbed, and then incorporated into the brain's structure. Many researchers have demonstrated that our modern diet often contains insufficient amounts of EPA & other Omega-3 EFAs.

What is the recommended dosage of Kirunal?

2 capsules, twice daily, with food or as directed by your HCP.

How long will 1 bottle last?

Kirunal is sold in 240 count bottles

How should it be taken?

Kirunal is not a drug. It will not provide an "overnight miracle". As with all nutritional approaches to health, the beneficial effects build slowly over weeks & months. If Kirunal is going to help you, you should begin to see positive signs within 6-12 weeks.

What are the ingredients?

215 mg. of EPA, 75 mg. of DHA, fish body oil, gelatin, glycerin, and water.

Are there any side effects?

There are no risks in trying Kirunal. In addition, Kirunal will not interfere with the effects of any other nutrients or medications.

You should not, under any circumstances, change any prescribed medical treatment because you have started to use Kirunal. Kirunal provides nutritional support, but does not replace your current treatment.

If you have any questions or concerns about taking Kirunal, we recommend that you consult your health care provider.
